EDUCATION

University of Washington

Bachelor of Science in Computer Science; GPA: 3.79/4.00

Seattle, WA

Sep. 2019 – Jun. 2023

EXPERIENCE

Software Engineer, Platform

Northwind Data

San Francisco, CA

Aug. 2023 – Present

- Rebuilt the ingestion pipeline on Kafka and Go, lifting sustained throughput from 40k to 180k events per second while cutting p99 write latency by 62%.
- Split a 90k-line Django monolith into four gRPC services behind a schema registry, shipping the migration in staged cutovers with zero customer-visible downtime.
- Introduced OpenTelemetry tracing across 14 services and cut median incident triage time from 45 minutes to 9 by making cross-service latency attributable.
- Replaced nightly batch rollups with incremental materialized views in PostgreSQL, reducing warehouse spend by \$18k per month.
- Owned the on-call rotation's reliability work for two quarters, driving error budget burn from 210% to 34% of the monthly allowance.

Software Engineer Intern

Cobalt Systems

Seattle, WA

May 2022 – Aug. 2022

- Built a Terraform module library that reduced new-service provisioning from a two-day manual checklist to a 15-minute templated pull request.
- Instrumented the deploy pipeline with Prometheus metrics, surfacing a cache misconfiguration that had been adding 300ms to every authenticated request.
- Wrote the load-test harness that became the release gate, catching a connection-pool regression that would have degraded checkout for 8% of sessions.
- Documented the provisioning path and paired with three engineers on their first service, removing the platform team as a bottleneck for new work.

PROJECTS

driftwood | Rust, WebAssembly, SQLite

Feb. 2024 – Present

- Built driftwood, an embedded change-data-capture engine that streams SQLite writes to any sink; 1.2k GitHub stars and 40k monthly crates.io downloads.
- Compiled the core to WebAssembly so the same replication logic runs in the browser, in a Cloudflare Worker, and on a Raspberry Pi from one codebase.
- Held replication lag under 50ms at 20k writes per second by batching on a lock-free ring buffer instead of a mutex-guarded queue.

paperweight | TypeScript, React, PostgreSQL

Jun. 2023 – Dec. 2023

- Developed paperweight, a self-hosted document search service indexing 400k PDFs with hybrid keyword and vector retrieval.
- Cut cold-start query time from 2.4s to 180ms by moving embeddings into pgvector with an IVFFlat index tuned against a labelled relevance set.
- Shipped an offline-first Electron client so the same index is searchable on a laptop with no network, syncing deltas on reconnect.

SKILLS

Languages: Go, Python, TypeScript, Rust

Frameworks/Tools: PostgreSQL, Redis, Kafka, gRPC, React, Node.js, Docker, Kubernetes, Terraform, AWS, Prometheus, OpenTelemetry
